Assessment and Monitoring of Forest Resources in the Framework of the EU-Russia Space Dialogue

Dr. Christian Hüttich
Prof. Dr. Christiane Schmullius
Friedrich-Schiller-University Jena

seit 1558

Monitoring & Assessment Needs: Forest area loss

- About 50% of Russian forests have been inventoried more than 25 years ago
- There are no **practically applicable methods** for updating growing stock volume in obsolete forest inventories (particularly for remote territories) **We have to know GSV!**

Reforestation

In post-Soviet Russia, more than 40 million hectares of arable land was abandoned within 20 years (Rosstat 2010).

Programmatic Context

FP7 Cooperation Work Programme “Space”

Activity: 9.3 Cross-cutting activities

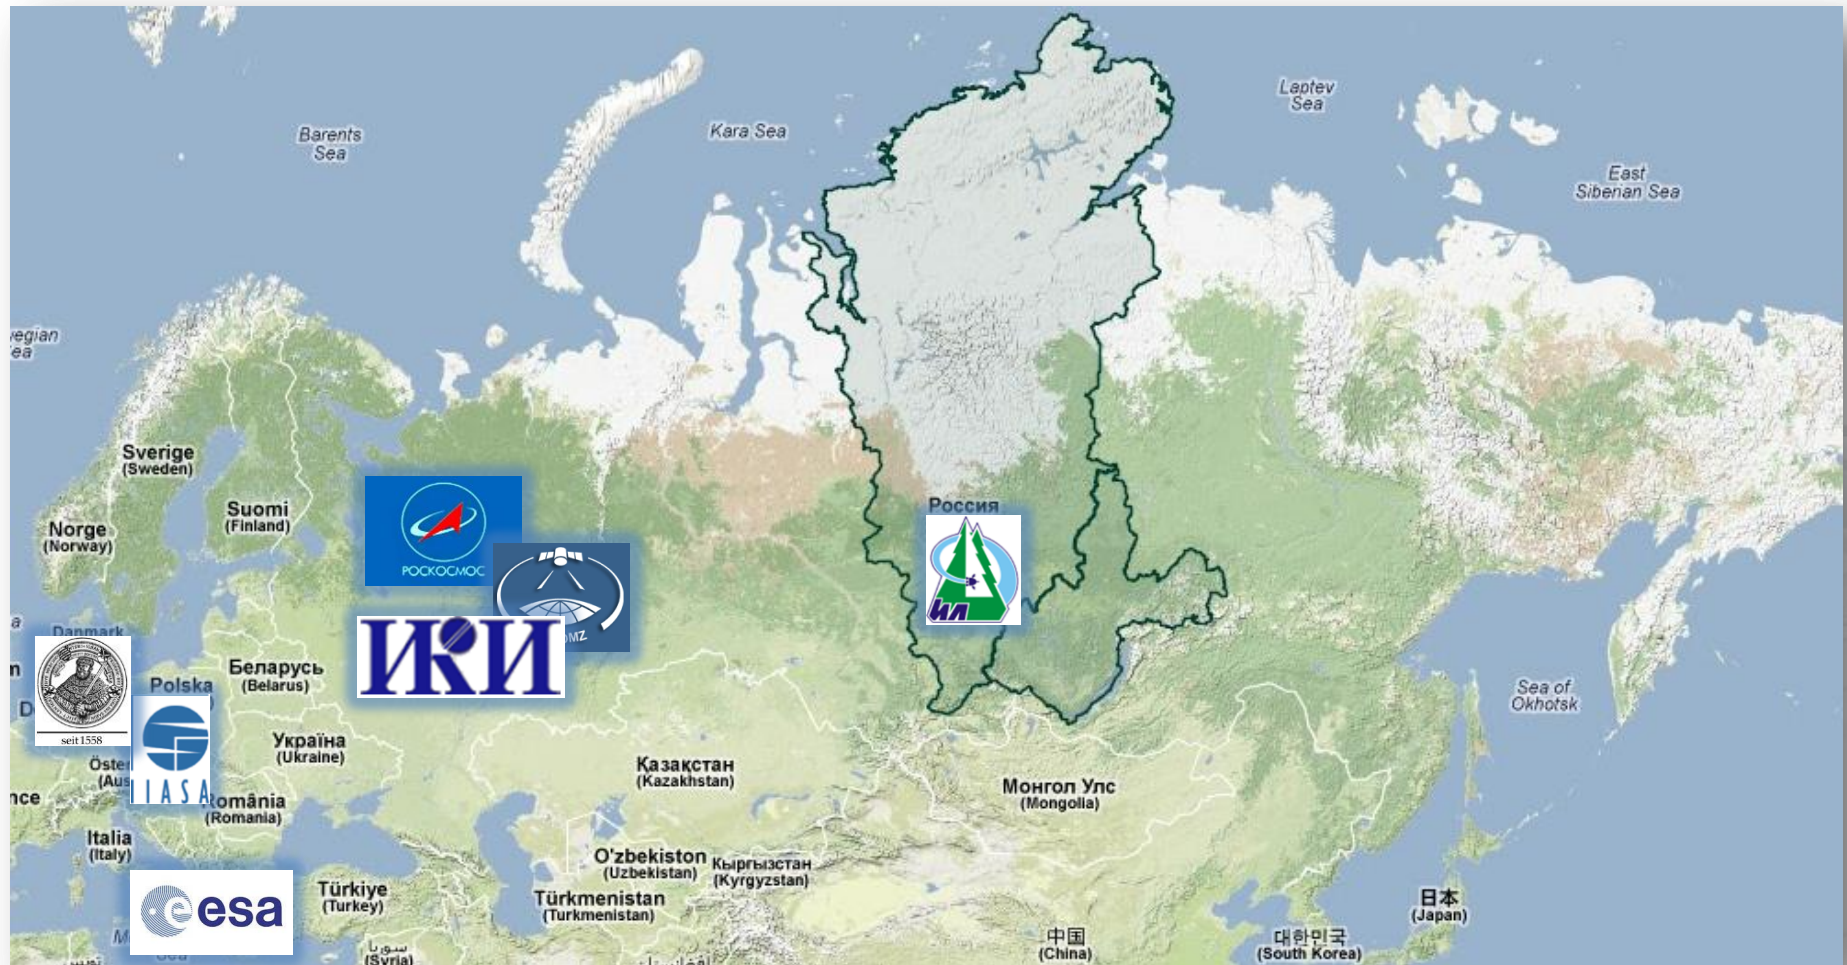

Area 9.3.2: International Cooperation

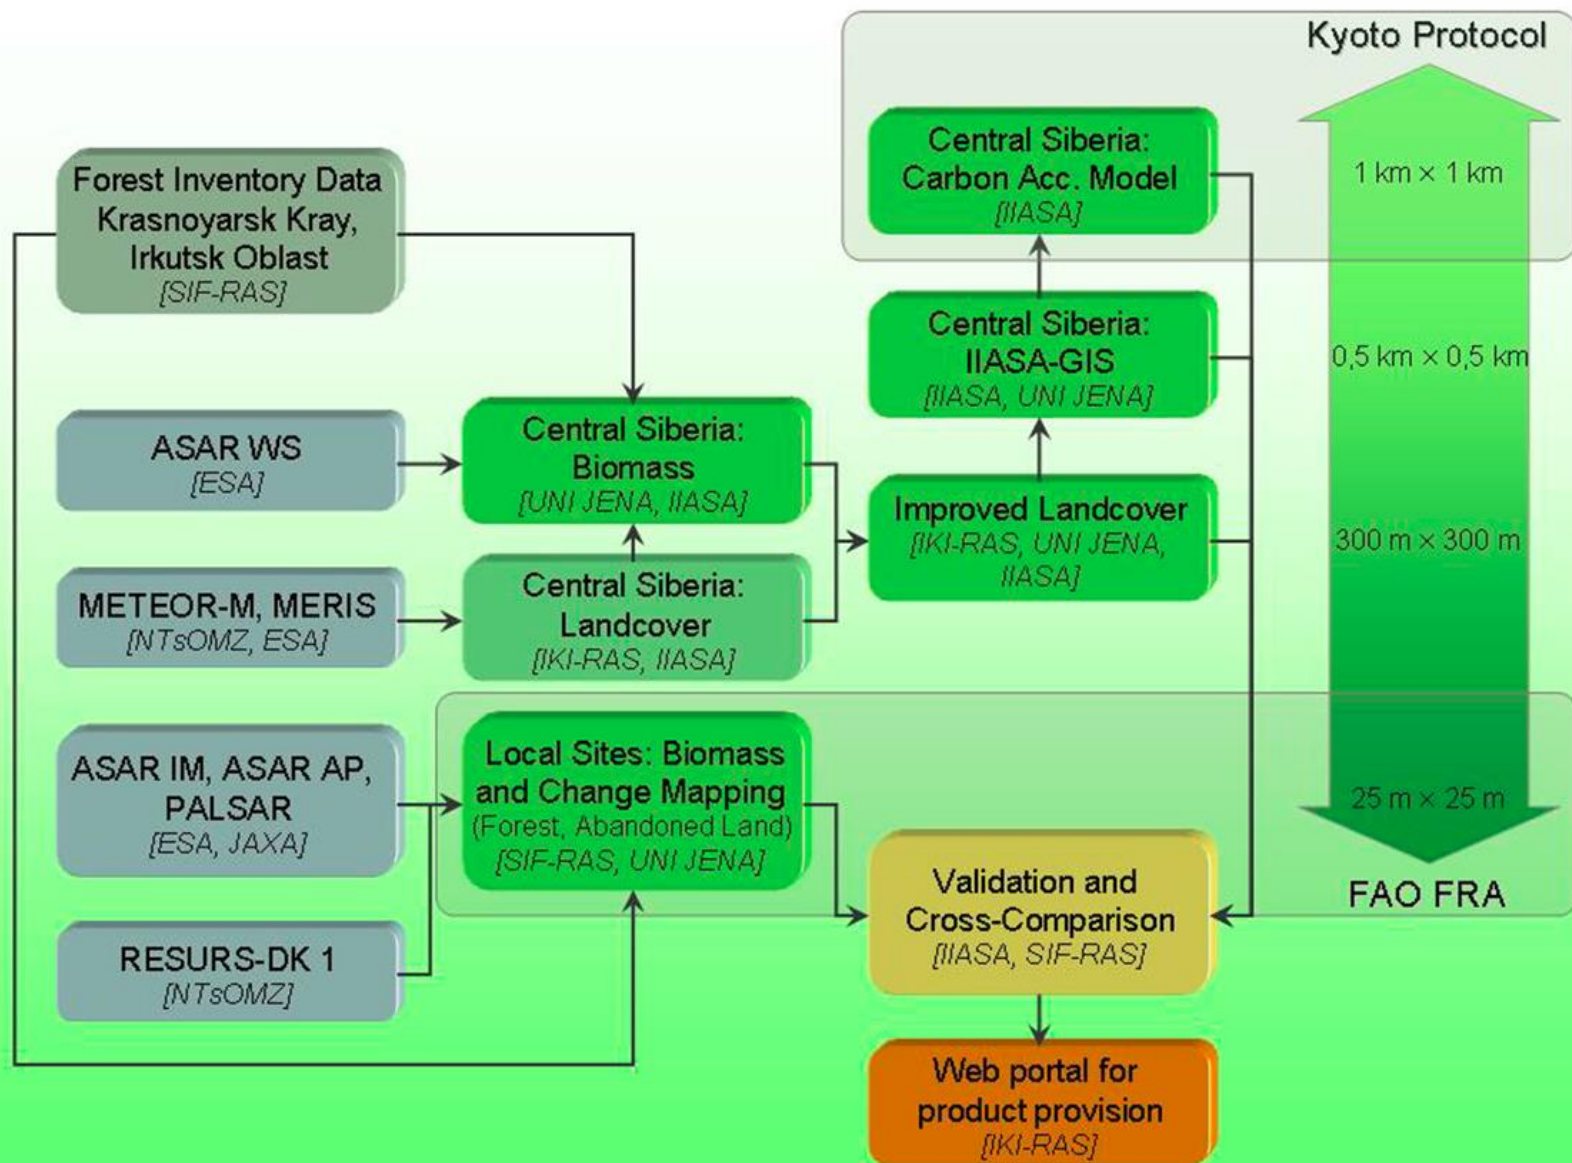

SPA.2010.3.2-01 EU-Russia Cooperation in GMES

- **Continuation** of EC- and GMES-cooperation activities with Russia since FP4 1994-`98
- Joint and **synergistic exploration** of EO data provided by ESA and ROSCOSMOS
- Exchange of methodological **know-how** in processing Earth Observation data

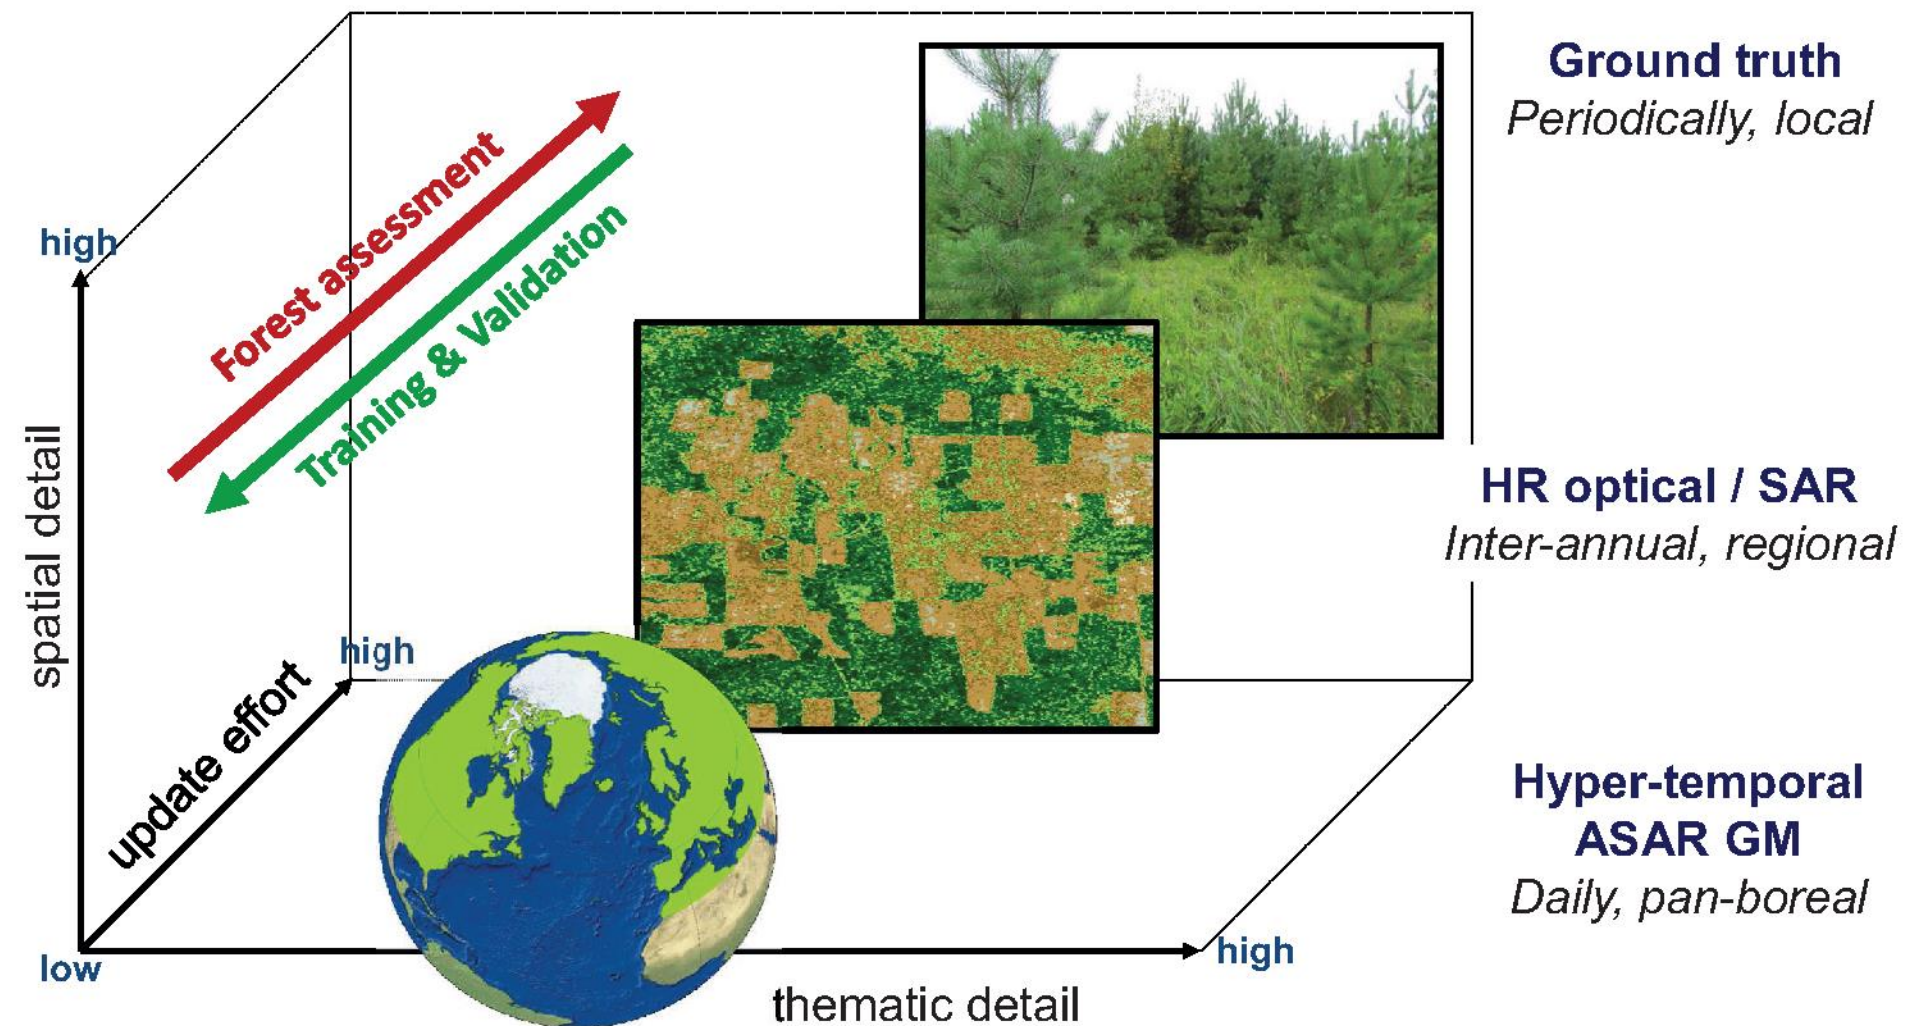

Team & Study area

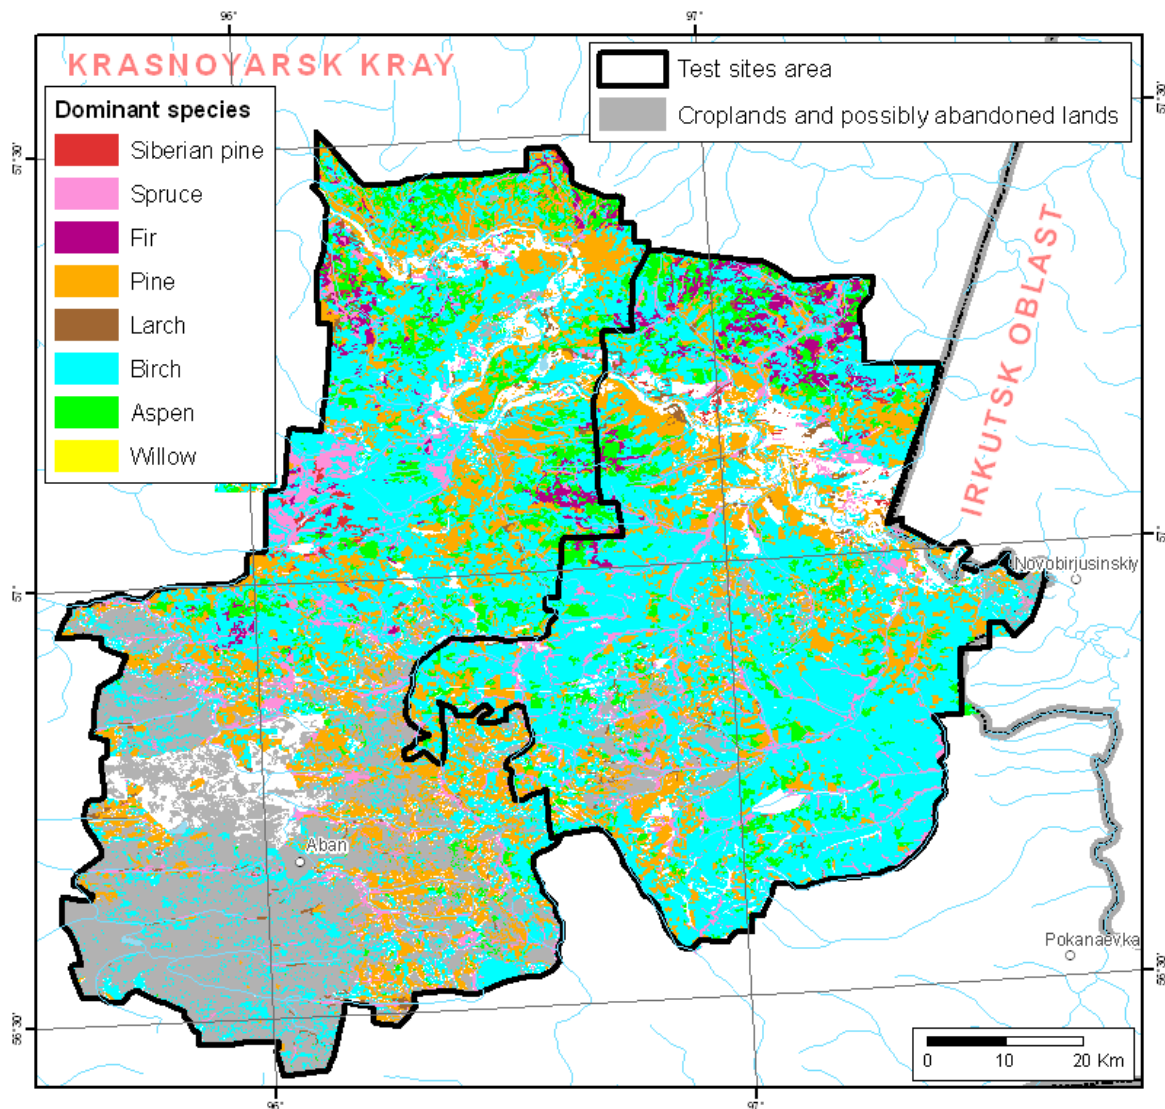

Integrated concepts for forest resource assessment

Forest Inventory - Species composition

Abanskoe

Landcover type	Stands	Area, ha
Birch	15979	197703
Pine	8673	115511
Spruce	2571	35659
Aspen	2036	35858
Fir	440	7902
Larch	406	5468
Siberian pine	125	2432
Willow	10	73
TOTAL	30240	400606

Other landcover types 1989 22153

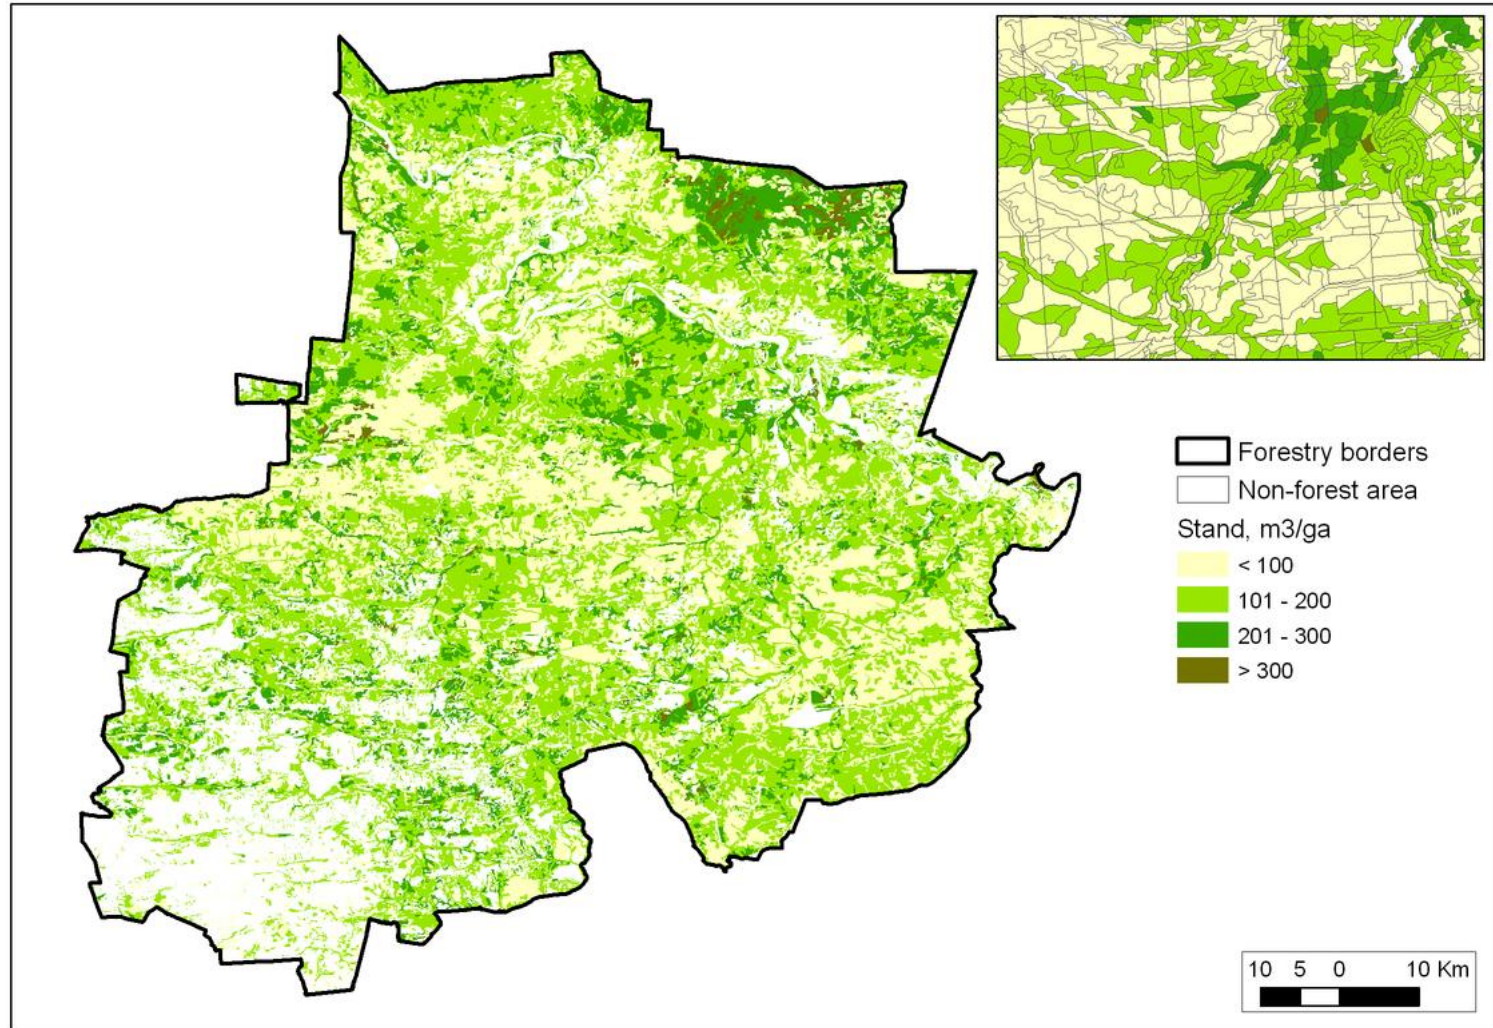

Dolgomostovskoe

Landcover type	Stands	Area, ha
Birch	6944	173608
Pine	2909	53742
Aspen	1048	26837
Spruce	1250	22655
Fir	435	10069
Larch	140	2578
Siberian pine	92	1352
Willow	6	23
TOTAL	12824	290865

Other landcover types 442 14661

Forest Inventory - Relative stock volume

RESURS DK1 – Reference Data

0 2 4 8 km

ALOS PALSAR – Biomass Maps (2007-2010)

Growing Stock Volume

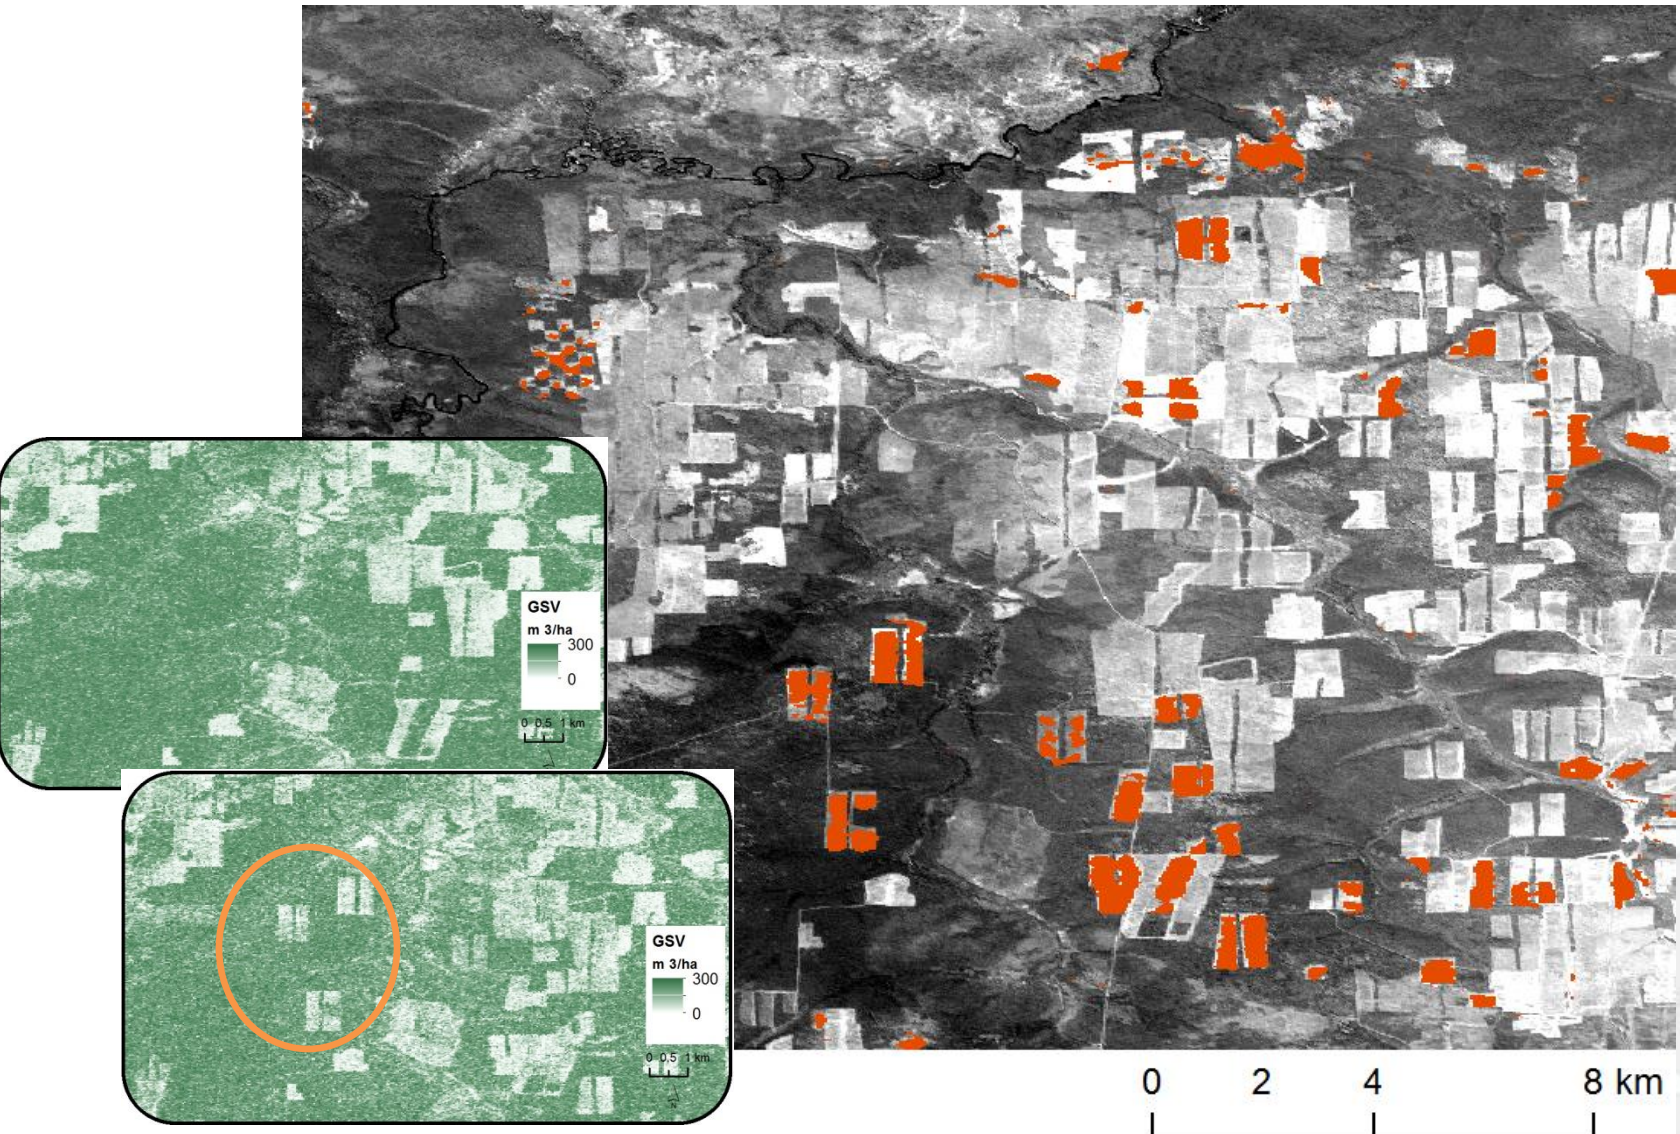

m³/ha

0 2 4 8 km

Deforestation Maps

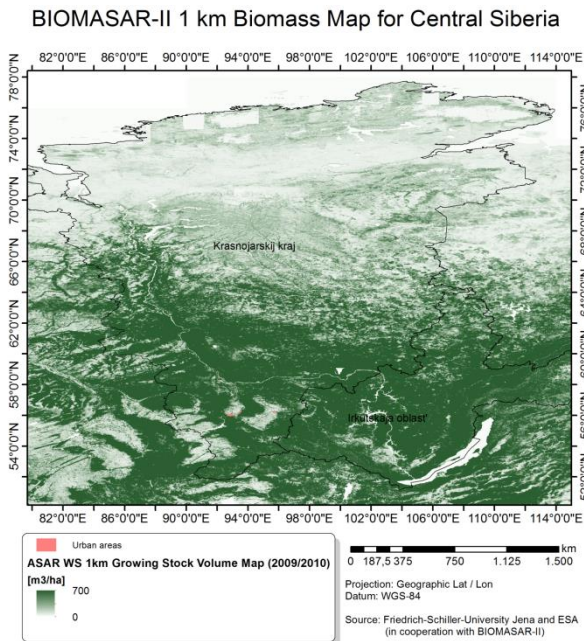

Reforestation Maps

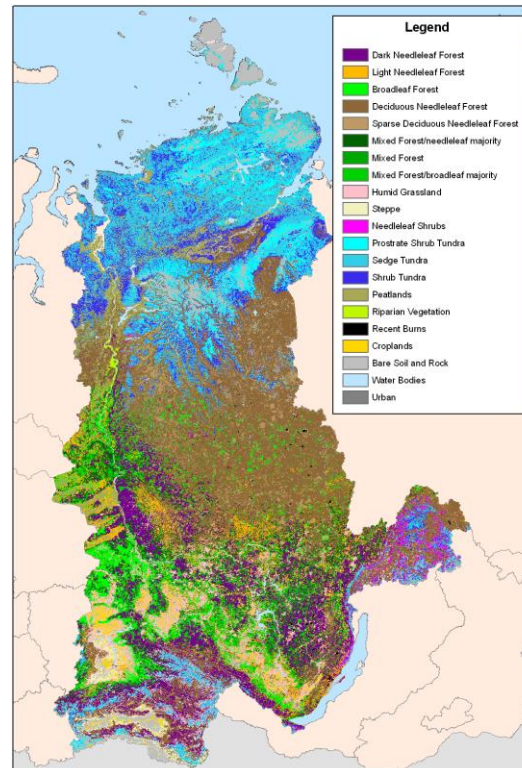

0 2 4 8 km

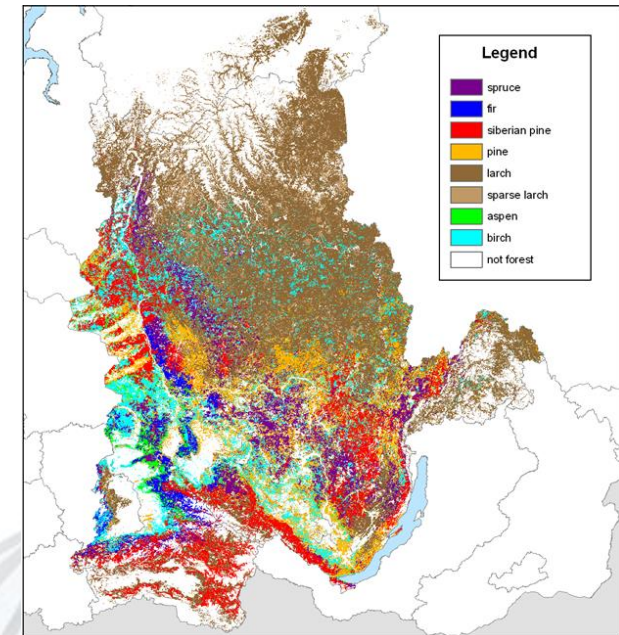

Improved Biomass, LC, and Species Maps for Siberia

Towards the Verified Full Carbon Account of Russian Forests

- There are no practically applicable methods for updating growing stock volume in obsolete forest inventories (particularly for remote territories) – **we have to know GSV**
- **In a systems approach knowledge of GSV would allow us to halve current uncertainty of FCA**

Full carbon account for Russia in 2009 – flux-based approach

All ecosystems of Russia in 2000-2010 served as a net carbon sink at 0.5-0.7 Pg per year

Uncertainty ~30% of this sink
~90% was provided by forests

Shvidenko et al. 2011

Summary

- **Joint exploitation of new (optical and radar) EO data**
 - There is little practical knowledge about the synergistic use of ESA and ROSCOSMOS data.
- **Analysis of up- and down-scaling effects of integrated data sets and products**
 - The comparability and possibility of combining EO forest products is still lacking.
- **Realization of cross-validation approaches**
 - Validation of biomass maps is mainly limited by the availability of inventory and in-situ data.

ZAPÁS links to current GEO tasks

- **SB-02 Global Land Cover**
 - Improve the use radar time-series products to characterize land-cover dynamics
 - Address cutting-edge technological issues related to global land cover/change

ZAPÁS links to current GEO tasks

- **SB-03 Global Forest Observation**
 - Supporting the GEO ForestCarbon Tracking (FCT) initiative.
 - Support the development of national forest information systems (e.g. GFOI)
 - Technical support on REDD+ MRV

ZAPÁS links to current GEO tasks

- **CL-02 Global Carbon Observation and Analysis**
 - Improve the resolution and accuracy of carbon budgets
- **EC-01 Global Ecosystem Monitoring**
 - develop monitoring techniques to assess changes
 - ecosystem extent
 - Condition
 - Structure
 - function, and composition
